

## Background

---

Scripts are often stored in the SYSVOL of the Domain Controller. These scripts might include sensitive data, such as credentials. Historically these scripts have been used to, among other things, set the password of the local administrator.

## How to test for

---

Passwords are usually not defined using a variable called "Password", so we will compile a list of strings that are common to use for passwords:

```
aPwd  
pwd  
password  
net user
```

```
net use x: \\dc01\sysvol  
x:  
gci -recurse -Include config *.bat, *.cmd, *.ps1, *.vbs, *.js, *.wsf, *.kix, *.txt | out-file C:\Users\<YOUUSER>\Documents\scriptse
```
